-!- TISSUE SPECIPICITY: Ubiquitous only for isoform 1, isoforms 2 and 3 are expressed predominantly in brain and T-lymphocytes.
-!- DEVELOPMENTAL STAGE: Maximally expressed at E7 day followed by E11, E15 and E17 days. In the limb development, its expression predominates in the limb buds at E12.5 day.
-!- PTM: Phosphorylated by MAP3K14/NIK, AKT and to a lesser extent by MERN: and dephosphorylated by PP2A. Autophosphorylated.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
                                                                                                  -!- SUBUNIT: Preferentially found as a heterodimer with IKK-beta but also as an homodimer. Directly interacts with IKK-gamma/NEMO. Heterodimers form the active complex. The tripartite complex can also bind to MAP3K14/NIK, MEKK1, IKAP and IKB-alpha-P65-P50 complex. A weak interaction with TRAR2 cannot be excluded. Part of a complex composed of NCOA2, NCOA3, IKKB, IKBKG and CREBBP (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (BY SIMILARITY).

    LYBEDF.
    SUBCELULIAL LOCATION: Cytoplasmic.
    TISSUE SPECIFICITY: Highly expressed in heart, placenta, skeletal muscle, kidney, pancreas, spleen, thymus, prostate, testis and peripheral blood.
    PTM: Phosphorylated by MEKK1 and probably also by MAPSK14/NIK.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBCELLULAR LOCATION: Cytoplasmic.
TISSUB SPECIFICITY: Expressed in liver, kidney and spleen.
DEVELOPMENTAL STAGE: While it is expressed ubiquitously throughout the mouse embryo, at B9.5 day its expression begins to be localized to the brain, neural ganglia, neural tube, and in liver at E12.5 day. At E15.5 day, the expression is further restricted to specific tissues of the embryo.

PTM: Phosphorylated by MEKK1 and probably also by MAP3K14/NIK.
                                                                                                                                                                                                                                   Jobin C., Sartor R.B.,
"The I kappa B/NF-kappa B system: a key determinant of mucosal
inflammation and protection.";
Am. J. Physiol. 278-c451-c462(2000).
-!- FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to
the dissociation of the inhibitor/NF-kappa-B complex and
ultimately the degradation of the inhibitor. Also phosphorylates
                                                                                                                                                                                                                                                                                                                                                                    also as a homodimer. Directly interacts with IKK-gamma/NEMO. Heterodimers form the active complex. The tripartite complex can also bind to MEKKI, MAP3K14/NIK, IKAP and IKB-ALPHA-P65-P50 complex. Phosphorylated IKB-alpha is further released from the complex. Found in a complex composed of NCOA2, NCOA3, IKRA, IKBKG and CREBBP (By similarity).

Am. J. Physiol. 278:C451-C462(2000)
-!- FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to the dissociation of the inhibitor/NF-kappa-B complex and ultimately the degradation of the inhibitor. Also phosphorylates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     complex. Phosphorylated IKB-alpha is further released from the complex. Found in a complex composed of NCOA2, NCOA3, IKKA, IKBKG and CREBBP (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- PTM: Phosphorylated by MEKK1 and probably also by MAP3K14/NIK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16-OCT-2001 (Rel. 40, Created)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                          February 18, 2004, 14:36:10; Search time 16.6974 Seconds (without alignments) 75.239 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 4, Application US/09109986

Patent No. 6479266

GENERAL INFORMATION:
APPLICANT: Rothe, Mike
APPLICANT: Rothe, Mike
APPLICANT: Rothe, Mike
APPLICANT: Rothe, Mike
APPLICANT: Rothe, Mike
APPLICANT: A gnier, Catherine
TITLE OF INVENTION: IKK-' Proteins, Nucleic Acids and Methods
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
ADDRESSES: SCIENCE & TECHNOLOGY LAW GROUP
STREET: 268 BUSH STREET, SUITE 3200
CITY: SAN FRANCISCO
STATE: CALIFORNIA
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: BIM PC COMPACIBLE
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: DatentIn Release #1.0, Version #1.30
CURRENT APPLICATION NUMBER: US/09/109,986

Directly interacts with IKK-GAWMA/NEWO. Heterodimers form the active complex. The tripartite complex can also bind to MAPBKI4/NIK, MEKKI, IKAP and IKB-alpha-P65-P50 complex. A weak interaction with TRAP2 cannot be excluded. Part of a complex composed of NCOA2, NCOA3, IKKB, IKBKG and CREBBP.

TISSUE SPECIFICITY: Widely expressed.

PTM: Phosphorylated by MAPSKA-MIK, AKT and to a lesser extent by MEKKI, and dephosphorylated by PP2A. Autophosphorylated.

SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE-21968797; Pubmed=11971985; NCOA2; NCOA3; IKKB AND IKEKG. Jobin C., Sartor R.B.;
"The I kappa B/NF-kappa B system: a key determinant of mucosal inflammation and protection.";
Am. J. Physiol. 278:C451-C462(2000).
-!- FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to the dissociation of the inhibitor/NF-kappa-B complex and the dissociation of the inhibitor. Also phosphorylates ultimately the degradation of the inhibitor. Also phosphorylates
                                                                                                                                                                                                                                                                                                                                                         when dephosphorylated.
SUBUNIT: Preferentially found as a heterodimer with IKK-beta but also as an homodimer. Directly interacts with IKK-gamma/NEMO. Heterodimers form the active complex. The tripartite complex can also bind to MAP3K14/NIK, MEKK1, IKAP and IKB-alpha-P65-P50 complex. A weak interaction with TRAF2 cannot be excluded. Part of a complex composed of NCOA2, NCOA3, IKKB, IKBKG and CREBBP (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Name=2; Synonyme=belta LH;

TISSUE SPECIFICITY: Ubiquitous only for isoform 1, isoforms 2 and are expressed predominantly in brain and T-lymphocytes.
DEVELOPMENTAL STAGE: Maximally expressed at E7 day followed by E11, E15 and E17 days. In the limb development, its expression predominates in the limb buds at E12.5 day.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- PTM: Phosphorylated by MAP3K14/NIK, AKT and to a lesser extent by MEKK1, and dephosphorylated by PP2A. Autophosphorylated.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES. IKAPPAB KINASE SUBFAMILY.

T. "Requilation of SRC-3 (pCIP/ACTR/AIB-1/RAC-3/TRAM-1) coactivator
T. "Requilation of SRC-3 (pCIP/ACTR/AIB-1/RAC-3/TRAM-1) coactivator
T. activity by I kappa B kinase.";
Mol. Cell. Biol. 22:3549-3561(2002).
I. PONCTION: Phosphorylates inhibitors of NP-kappa-B thus leading to the dissociation of the inhibitor of NP-kappa-B complex and ultimately the degradation of the inhibitor. Also phosphorylates
NCOA3 (By similarity).
C. !- SUBUNIT: Preferentially found as a heterodimer with IKK-alpha but also as a homodimer. Directly interacts with IKK-gamma/NEMO.
Heterodimers form the active complex. The tripartite complex can also bind to MEKKI, MAP3KI4/NIK, IKAP and IKB-alpha-P65-P50
Complex. Phosphorylated IKB-alpha is further released from the complex. Found in a complex composed of NCOA2, NCOA3, IKKA, IKBKG

Am. J. Physiol. 278-C451-C462(2000).
-!- FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to the dissociation of the inhibitor/NF-kappa-B complex and ultimately the degradation of the inhibitor. Also phosphorylates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: Preferentially found as a heterodimer with IKK-alpha but also as a homodimer. Directly interacts with IKK-gamma/NEMO. Heterodimers a homodimer active complex. The tripartite complex can also bind to MEKKI, MAPSKI4/NIK, IKAP and IKB-alpha-P65-P50 complex. Phosphorylated IKB-alpha is further released from the complex. Found in a complex composed of NCOA2, NCOA3, IKKA, IKBKG and CREBBP (By similarity).
                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                             -1. PATHWAY: Indole alkaloids biosynthesis.
-1. SUBCELLULAR LOCATION: Vacuolar membrane (Probable).
-1. TISSUE SPECIFICITY: Upper and lower leaf epidermis.
-1. SIMILARITY: Belongs to the cytochrome P450 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            90.0%; Score 36; DB 1;

"50 million years of genomic stasis in endosymbiotic bacteria.";

Science 296:3376-2379 (2002).

-! FUNCTION: Cytochrome O terminal oxidase complex is the component

of the aerobic respiratory chain that predominates when cells are

grown at high aeration (By similarity).

-! CATALYTIC ACTIVITY: Ubiquinol-8 + H(2)O.

-! SUBCELULAR LOCATION: Integral membrane protein (By similarity).

-! SIMILARITY: SOME, TO MITOCHONDRIAL OR BACTERIAL COX2 SUBUNITS.

BUT LACK HEME-BINDING DOMAIN.

-1- FUNCTION: CYTOCHROME O TERMINAL OXIDASE COMPLEX IS THE COMPONENT OF THE AEROBIC RESPIRATORY CHAIN THAT PREDOMINATES WHEN CELLS ARE GROWN AT HIGH AERATION (BY SIMILARITY).

-1- CATALYTIC ACTIVITY: Ubiquinol-8 + 0(2) = Ubiquinone-8 + H(2)0.

-1- SUBCELLULAR LOCATION: Intregral membrane protein (By similarity).

-1- SIMILARITY: SOME, TO MITOCHONDRIAL OR BACTERIAL COX2 SUBUNITS.

BUT LACK HEME-BINDING DOMAIN.
                                                                                                                                                                                                                                                       Buchnera aphidicola (subsp. Acyrthosiphon pisum) (Acyrthosiphon pisum symbiotic bacterium).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Probon, PD000131, Copper CuA; 1.

-I-STMCTION: CYTOCHROWE O TERMINAL OXIDASE COMPLEX IS THE COMPONENT OF THE ABROBIC RESPIRATORY CHAIN THAT PREDOMINATES WHEN CELLS ARE GROWN AT HIGH ARRATION (BY SIMILARITY).

-I-CATALYTIC ACTIVITY: Ubiquinol-8 + O(2) = Ubiquinone-8 + H(2)O.

-I-SIMILARITY: SOME, TO MITOCHOUDRIAL OR BACTERIAL COXZ SUBUNITS.

BUT LACK HEME-BINDING DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TIGRPAMS; TIGR01433, Cyoā, 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cycohrome P450 - Madagascar periwinkle
Cypecies: Catharanthus roseus (Madagascar periwinkle)
Cypecies: Catharanthus roseus (Madagascar periwinkle)
Cypecies: 16-Uul-1999 #sequence_revision 16-Uul-1999 #text_change 16-Feb-2001
Cypecesion: T09999
RyMangold, U.; Eichel, J.; Batschauer, A.; Lanz, T.; Kaiser, T.; Spangenberg, G.; Werck-Plant Sci. 96, 129-136, 1994
AyTitle: Gene and CDNA for plant cytochrome P450 proteins (CYP72 family) from Catharanth A;Reference number: 216915
AyAccession: T09999
AyStatus: preliminary; translated from GB/EMBL/DBJ
AyRetus: preliminary; translated from GB/EMBL/DBJ
AyRetus: preliminary;
AyMolecule type: DNA
AyErose-references: EMBL:119074; NID:9404687; PID:9404688
AyErose-references: EMBL:119074; NID:9404687; PID:9404688
AyExperimental source: cv. cp3
CyGenetics:
AyGene: CYP72B
AyIntrons: 96/1; 170/3; 252/2; 381/3
CySuperfamily: human cytochrome P450 CYP4B1; cytochrome P450 homology
CyKeywords: heme; iron; metalloprotein
F;329-492/Domain: cytochrome P450 homology <P45>
F;470/Binding site: heme iron (Cys) (axial ligand) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      probable cytochrome P450 protein - Madagascar periwinkle
NyAlternate names: CYP72 protein
NyAlternate names: CYP72 protein
Cypecias: Catharanthus roseus (Madagascar periwinkle)
Cypecias: Catharanthus roseus (Madagascar periwinkle)
Cypecias: 16-701-1999 #sequence_revision 16-701-1999 #text_change 16-Feb-2001
CyAccession: T09944
